Correction: At timestamp 0.05 in the video above, the ending square bracket is missing. It should be

`python print(f"Hello {kwargs['execution_date']}")`

Here is the Apache Airflow documentation on **context variables** that can be included as kwargs.

Here is a link to a blog post that also discusses this topic.

Runtime Variables

Airflow leverages templating to allow users to "fill in the blank" with important runtime variables for tasks.

```python
from airflow import DAG
from airflow.operators.python_operator import PythonOperator

def hello_date(*args, **kwargs):
    print(f"Hello {kwargs['execution_date']}")

divvy_dag = DAG(...)
task = PythonOperator(
    task_id='hello_date',
    python_callable=hello_date,
    provide_context=True,
    dag=divvy_dag)
```
